

## ATTACHMENT

Section 7.5 of the FFA (Groundwater Remedial Program), subsections g and h, read as follows:

g. The Navy agrees to conduct a specific investigative task that includes, but is not necessarily limited to, installation of additional groundwater monitoring wells, vertical profile borings, and groundwater sampling to determine the extent of contamination in the vicinity of monitoring well GM-75D2. After the area is assessed, a determination will be made regarding the necessity for implementation of a contaminant mass removal program. If a determination is made by either the Navy and/or NYSDEC, that a significant threat to a downgradient public water supply exists, then a plan of action will be documented in a report and forwarded to NYSDEC.

h. The Navy agrees to conduct a specific investigative task that includes, but is not necessarily limited to, installation of additional groundwater monitoring wells, vertical profile borings, and groundwater sampling to determine the extent of contamination in the vicinity of any other area where additional groundwater investigations have been determined to be required in order to assess whether that area represents a significant threat to a downgradient public water supply. The trigger value used to determine if such additional groundwater investigations are necessary is a detection of 1 part per million (ppm) of total volatile organic compounds (TVOCs) in three consecutive sampling events in any one well.
